

# FreeAgent Coding Test

Your challenge for today is to provide code for obtaining and calculating foreign exchange rates using a given source.

## Timescales

- We don't expect you to have to dedicate more than a couple hours to this.
- We don't want this to take too much of your time. If you think it's going to due to other commitments, please let us know.

## Requirements

- Your solution should be written in Ruby
- We want to know what the exchange rate is between two currencies on a given date.
- In the future we will want to switch between different sources of foreign exchange rates and we would like you to design your solution with this in mind. Other sources might not be JSON and may not be based on the EUR.

## Delivery

- We have provided a README in which you can explain any significant design decisions you've made or questions you had about the requirements.
- We would prefer you to deliver your solution as a zip file. If that presents a problem for any reason, just let us know.

## Getting Started

- Check out the FreeAgent [Engineering values](#).
- Unzip the template then visit INSTRUCTIONS.md.
- If you have not coded in Ruby before, that's okay. We'll take that into account during our evaluation.
